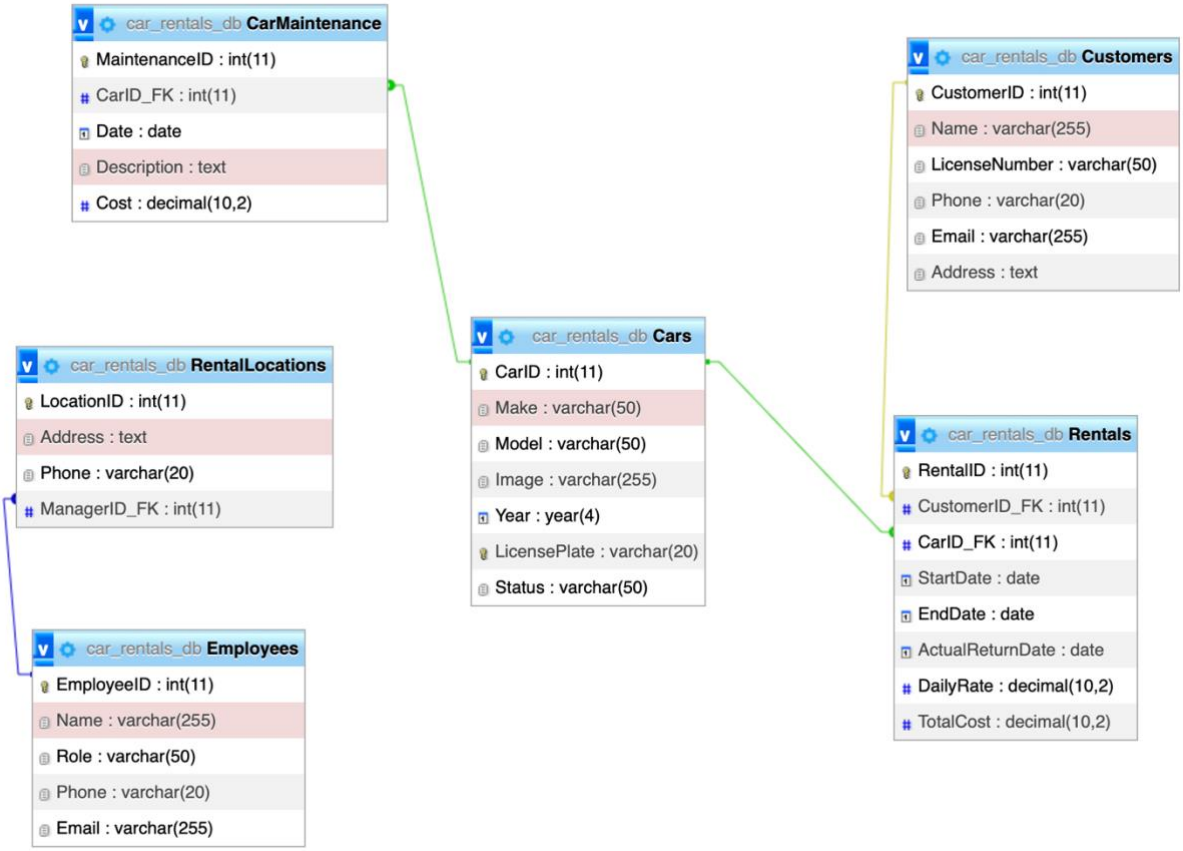
Car rental database Scenario

Car_rentals_db in PHPMYADMIN data designer



1. This exercise requires Car Rentals exercise1 to be completed fiirst.
2. Create a new file called “dbTrans.php” that will act as a module. This file will contain all PHP/SQL related functions. Functions need to take and return parameters.
    a. Create the ConnectToDb() that returns and connection called $conn.
    b. Create the SelectAllCars() that takes the $conn as parameter and returns a result called $result.
    c. Add this new module in ShowCars.php and make sure it works correctly.

3. Create a new php file called “MaintRecords.php” that gets a query string from a URL to ge the relevant log information according to the selected Cars.
    a. Add another function in dbTrans.php called getMaintRecords() that takes $conn and the $carId and returning $result.
    b. Add this DbTrans.php module in MaintRecords.php and make sure it works correctly.

BMW 5 Series
