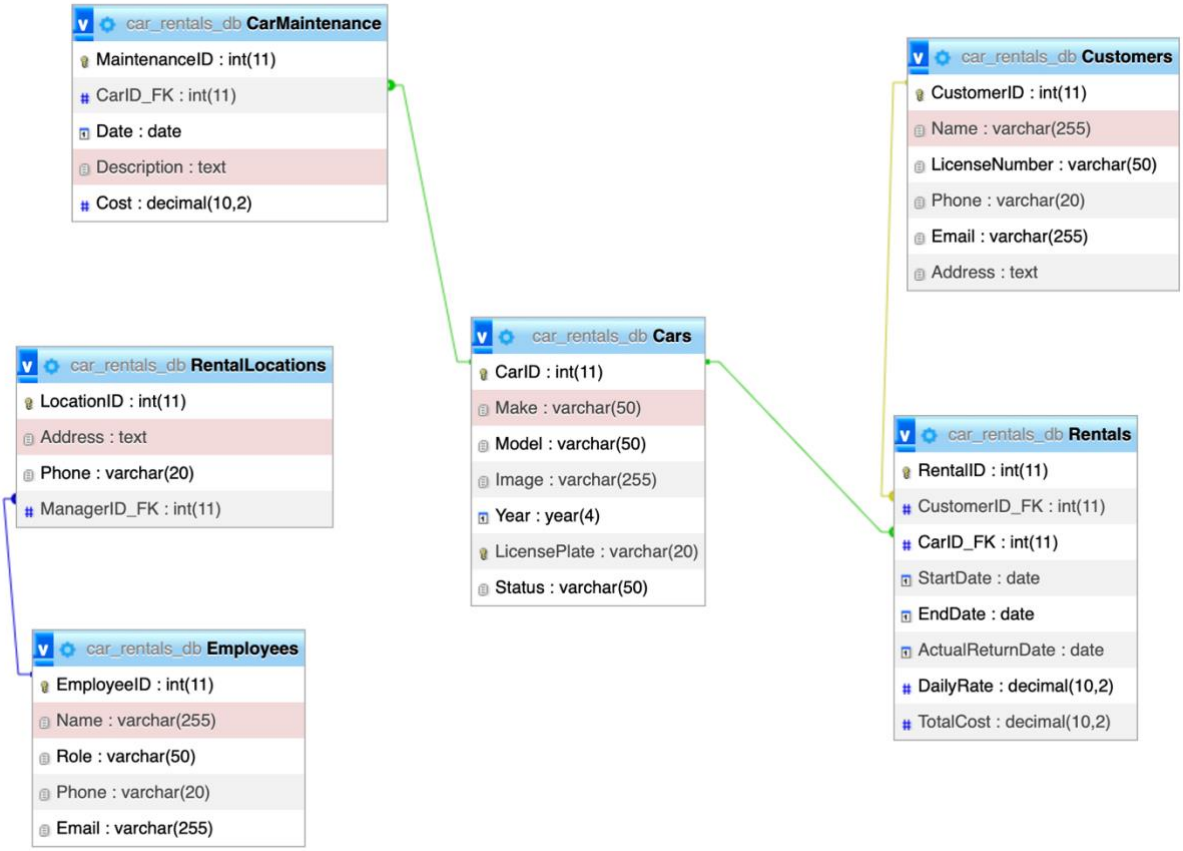
Car rental database Scenario

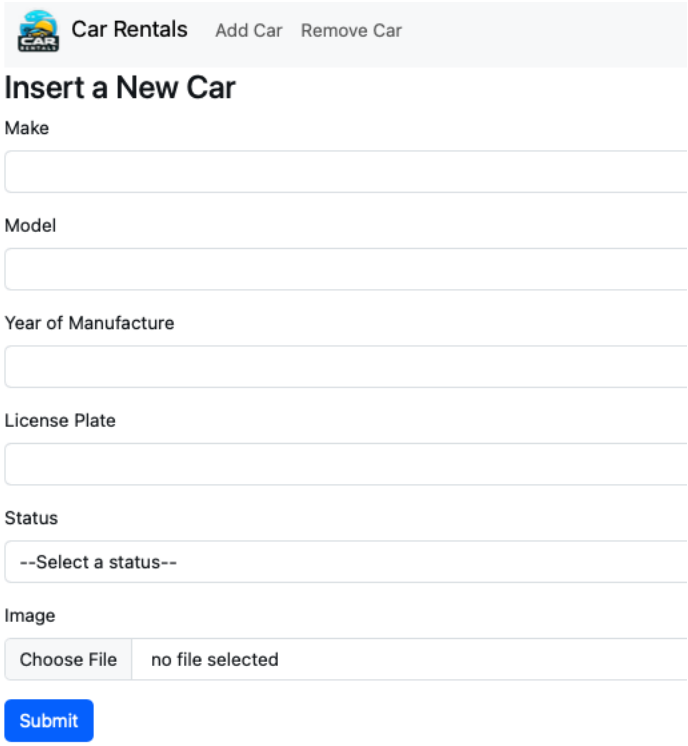
Car_rentals_db in PHPMYADMIN data designer



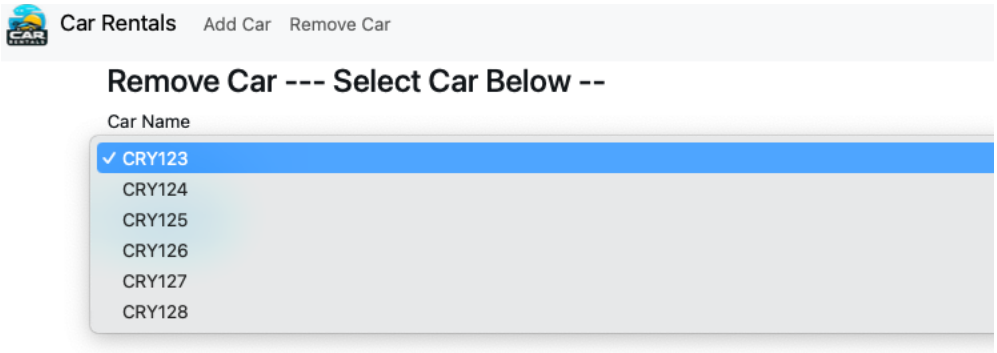
1. This exercise requires Car Rentals exercise 1, 2 and 3 to be completed fiirst.
2. Create a new php file called AddCar.php. This will add a new car in the car rentals database.
3. First adjust the link in the menu to point to the new AddCar php file to add a Car.
4. Add the relevant bootstrap libraries in the head section of the AddCar.php .The AddCar php file requires the following information to be added:
    a. Make of Car
    b. Model of Car
    c. Year of manufacture
    d. Licence plate

e. Status

5. Make sure that you use modules correctly, in this case DbTrans.php such that SQL related function live inside that module.
6. Make use of prepared SQL statements and proper data binding such that correct techniques against SQL injection are applied.
7. Test the php form and test that information is correctly added to the database via DbTrans.php
8. Add a file upload component to the AddCar form that accepts images to tbe uploaded. The image of the car will be added to the images folder on the server. The path of the file will be added to the database.
9. Test the functionality and make sure that the code is working. Note additional images havebeen added to VLE for testing. Alternatively you may download your own images.



10. Now add a facility to remove cars from the database called RemoveCar.php.
11. Add the respective function in Dbtrans.php
12. Add a drop-down in RemoveCar.php to choose from the list which car to be removed based on the licence plate.



13. Test out your code and make sure data can be added and removed from the database succesfully.
